Development Proposal

Agricultural Auction Platform

Version 2 — updated according to the KickOff Documentation

Client:	Agro Oro - Paraguay Remates
Project:	Online Auction Platform (100% web)
Provider:	Eliseo Pets
Date:	October 27, 2026
Currency:	US dollars (USD)
Valid for:	30 days from the date of issue

Proposal summary

Item	Value
Development timeline	2 to 2.5 months (9 to 11 weeks)
Development and implementation (one-time payment)	USD 4,000
Monthly maintenance, infrastructure included, starting at go-live	USD 1,200 / month

Implementation specifications

This proposal covers the complete, fully functional implementation of **Paraguay Remates**: an online auction platform with a catalog of verified sellers, designed so that the agricultural community can understand it at a glance. Any registered and identified user can bid in real time; approved sellers list their products, and an administrator moderates users, listings and transactions. The platform is **100% web-based**, accessible from the browser of any phone or computer, with nothing to install. It also integrates with WhatsApp through **two parallel solutions**: one for message collection and one for channel notifications.

The platform is sized for the **12,000 users** who currently follow Paraguay Remates' existing operation.

Implementation scope

Users and roles

- Registration with personal details, mobile number and **upload of the national ID card** (cédula) or tax ID (RUC).
- **Mobile number verification via WhatsApp**, with a code sent through the official WhatsApp Business API.
- **Read-only mode** for users who do not provide their ID: they can browse, but cannot bid or list.
- Automatic format and duplicate checks; doubtful cases go to a **manual review queue**.

- Seller application, with acceptance of the seller agreement and **manual approval** by the administrator.
- 2FA via WhatsApp to enable bidding, with the device remembered for 30 days.
- Acceptance of the Terms of Service, recorded with date, time and version.
- User suspension and removal by the administrator.

Listings and catalog

- **Listing by the seller** (or by the administrator on their behalf): technical specifications, up to 10 photos, auction type, starting price where applicable, currency, location and inspection details.
- The seller sets the **bid increment** (for example, in steps of 10 or of 50,000).
- **Recommended increment tiers**: the platform suggests the increment based on the listing's price range, and the seller can change it.
- **Configurable duration**: by default, visible for 21 days and open for bidding for 7 days.
- Removal of listings that do not comply with the terms of use.
- Public catalog with filters by category, brand, year, location and price.
- Auction page designed to be read at a glance: **time remaining, highest bid and status**.

Auction types

The seller chooses the auction type when listing:

- **Absolute auction** (*remate al martillo*): no starting price. Bidding starts from zero and the item is always awarded to the highest bid.
- **Reserve-price auction** (*remate con precio de reserva*): bidding starts from the minimum (starting) price set by the seller, which is visible to everyone. If nobody bids, the auction closes with no sale.

Auction engine

- Server-side bid validation, using each listing's bid increment.
- **Next bid amount always visible**, with no way to bid below the minimum.
- **Explicit confirmation** before each bid is placed.
- **Automatic maximum bid** (proxy bidding), with ties broken by the order in which bids were entered.
- **2-minute extension** if a bid is placed in the last 2 minutes (configurable values).
- Anonymous alias per listing.
- **Bid history** with user, amount and timestamp, for full traceability.
- Automatic close on the clock: awarded or no sale.
- Bid cancellation by the administrator, with the reason recorded.

Real time

- WebSocket with an authoritative server.
- Countdown synchronized with the server clock.

- Automatic reconnection with full resynchronization after a connection drop or a browser shutdown.
- No bids can be sent while offline; automatic maximum bids keep running on the server.
- Polling fallback if the WebSocket cannot connect.

WhatsApp integration

Two parallel solutions, independent from each other and from the platform: if one is interrupted, the other one and the auctions keep running.

- **Message collection**: capture of WhatsApp messages related to the operation, linked to the corresponding auction and user, and fed into the admin panel for follow-up.
- **Channel notifications**: automatic posting of auctions to the Paraguay Remates WhatsApp channel, with text, photo and a link to the auction page.
- Posting queue with the KickOff limits: each post lasts **30 minutes** and there are **up to 5 per day**, with priority set by the administrator.
- Sending pace and variations that emulate human behavior, from a number dedicated to the integration.
- Log of every collected message and every notification sent, with failure alerts.

In-platform notifications

All user notifications are shown within the web platform:

- Confirmation of every bid placed.
- New bids on auctions the user is participating in.
- **Outbid**: a notice to every outbid participant, with a button to **bid the next increment** (with confirmation).
- Maximum bid exceeded, final minutes and award.

Sharing and live streaming

- Rich link previews when sharing on WhatsApp, Facebook and other networks.
- Space on the auction page to **embed a live stream** (YouTube or Facebook Live) during events.

Reputation

- **Reviews with a rating and a comment** between buyer and seller, once the transaction is closed.
- Public profile showing the average rating and the comments received.

Post-auction

- Notification to the winner, the seller and the administrator.
- **PDF award certificate** with a sequential number (N001, N002, N003...), certifying who the sale was awarded to. It is not a tax document.
- **Non-tax receipt** for each award, with the transaction details, for collections management.
- **Collection status** of each transaction in the admin panel: pending, paid or overdue.

- Record of the transaction closing (payment and delivery), which enables reviews.
- **On-demand export of any auction**, at any time, with its full history (CSV and PDF).

Admin panel

Live monitoring · user and seller verification · listing moderation · settings · transaction closing · collections · exports.

Platform

Append-only audit log · verified backups · monitoring with alerts · concurrency and load testing with 12,000 simultaneous users · operations runbook · 2-hour training session.

Scope decisions for version 1

Adjustments to the KickOff definition to achieve a simple, secure operation that can be delivered within the proposed timeline.

Decision 1 — One currency per listing, no conversion

What is dropped: conversion table, dual formatting, currency equivalents.

What remains: each listing is entered in USD or in Paraguayan guaraníes (PYG), and the whole auction runs in that currency.

Why. Agricultural machinery is mostly priced in dollars, but the KickOff's example of a 50,000 increment suggests listings in guaraníes. Choosing the currency per listing covers both cases without the complexity of conversion.

Decision 2 — Semi-automatic identity verification

What is dropped: biometric verification or checks against official records.

What remains: automatic checks for format, duplicates and the RUC check digit. Every doubtful case, and every seller, goes through manual review by the administrator.

Why. There is no accessible public service to validate ID cards online, and private services charge per query. With a strict seller catalog, manual review is what provides the real guarantee.

Out of scope for version 1

These remain open items from the KickOff and can be quoted separately once defined:

- Auctions secured by collateral (a refundable upfront payment). This requires integrating a payment gateway.
- User behavior metrics, beyond operational monitoring.
- Legal and tax review of the operation and of the data policy. The platform records acceptance of the terms and stores data securely, but the legal texts are defined by the client with their advisor.
- **Integration with the client's legal invoicing system**. It will be quoted once we receive an example of the current invoice ("servicio publicidad", i.e. advertising service), the definition of the legal operation and the system details. Version 1 includes an initial review of invoicing

for auctions.

- **Individual WhatsApp messages** to each outbid participant. From the integration number, the message volume would be considered spam and would expose the number to suspension. It is feasible with the official API, but each message has a cost and users must opt in to receive them.
- Online payments, mobile apps and delivery logistics.

Cost estimate

Estimated hours and development fee

Estimate for a **10-week** timeline (between 2 and 2.5 months), with **2 developers** working **8 hours a day, Monday to Friday**. The hours shown are the total team effort.

Item	Scope	Hours
Planning, design and initial setup	Functional definition, screen design for rural users, invoicing review, architecture, environments and base structure.	68
Users, identity and roles	Registration with ID, read-only mode, WhatsApp verification and 2FA (official API), terms, manual review queue, seller application and approval, suspensions.	96
Listings and catalog	Seller listing, photos, technical specifications, bid increment and recommended tiers, configurable duration, moderation, filtered catalog and public auction page.	96
Auction engine	Absolute and reserve-price auctions, bid validation, minimum bid, confirmation, automatic maximum bid, tie-breaking, extensions, aliases, history, automatic close and cancellation with reason.	124
Real time and scalability	WebSocket, synchronized countdown, reconnection, polling fallback and readiness for 12,000 simultaneous users.	72
WhatsApp: message collection	Dedicated number, message capture, linking to auctions and users, admin panel view.	48
WhatsApp: channel notifications	Automatic posting, queue with 30-minute and 5-posts-per-day limits, human-like sending pace, logging and alerts.	40
Notifications, sharing and live	In-platform notifications with quick bid of the next increment, social link previews and embedded live stream.	24
Reputation	Reviews with rating and comment, public profile with average.	32
Administration and post-auction	Admin panel, live monitoring, settings, sequential PDF certificate, non-tax receipt, collection status, on-demand export and auditing.	96
Testing and go-live	Functional, concurrency and load testing, fixes, deployment, documentation and training.	80
Contingency reserve	Buffer for unforeseen technical issues and adjustments within the agreed scope.	24
Total	**Estimated timeline: 10 weeks of work.**	**800**
	Development and implementation	**USD 4,000**

Schedule

Weeks	Work	Milestone
1 – 2	Planning, screen design, technical foundation, users and roles.	Design approved
3 – 5	Listings, catalog, auction engine and real time.	Engine demo
6 – 7	WhatsApp integration (message collection and channel notifications), in-platform notifications, sharing and reputation.	Beta version
8 – 9	Administration, post-auction, collections, load testing and fixes.	Acceptance
10 (– 11)	Go-live, training and support during the first auction cycle. Week 11 is a contingency buffer.	Go-live

Development payment terms

Milestone	%	Amount
Project start	40%	USD 1,600
Beta version delivery (week 7)	30%	USD 1,200
Go-live	30%	USD 1,200
	Total	**USD 4,000**

Monthly maintenance

Starting the month after go-live, for **USD 1,200 per month**, the platform is kept running, secure and evolving. This is a single fee that **includes all infrastructure**: servers, database, image storage, backups, domain, WhatsApp integration, WhatsApp verification messages and monitoring, sized for the current 12,000 users and adjusted as usage grows.

Includes:

- Continuous monitoring with alerts and incident response, with priority during auction closings.
- Fixes to defects in the delivered functionality, prioritized by their impact on the operation.
- Security updates for the system, dependencies and certificates.
- Backup verification and a monthly restore test.
- Follow-up of the WhatsApp integration and, if Meta suspends the integration number, its replacement and reconfiguration.
- Support for Paraguay Remates administrators on business days.
- Up to **20 hours per month** of minor adjustments and improvements (non-cumulative).

Not included: larger new developments (for example, the items out of scope for version 1), which are quoted separately, or content loading and day-to-day moderation of the platform.

Assumptions

- The domain is registered in the client's name.
- The client provides a WhatsApp number dedicated to the integration, separate from the one that manages the channel. As documented in the KickOff, Meta does not offer an official way to automate channels, and the risk of suspension falls on that number, not on the channel.
- The client provides the legal texts (terms of service and seller agreement) and the content of the first listings.
- The client's approvals at each milestone are given within 3 business days; delays extend the timeline by the same amount.
- Scope changes after design approval are estimated and agreed separately.
